We are pleased to welcome you to the " Annual Summit on Organ Transplantation " after the successful completion of the series of transplantation Congress. The congress is scheduled to take place in the beautiful city of Barcelona, Spain. This organ transplantation conference will provide you with an exemplary research experience and huge ideas.

The perspective of the organ transplantation Conference is to set up transplant research to help people understand how treatment techniques have advanced and how the field has developed in recent years

Organ transplantation is often the only treatment for end-of-state organ failure, such as liver and heart failure. Renal replacement therapy, renal transplantation is the end-stage renal disease patients may be treated with other is generally accepted as the best treatment for both quality of life and cost-effectiveness. Kidney transplantation is by far the most frequently performed transplantation in the world

Several organs that have been successfully transplanted include the heart, kidneys, liver, lungs, pancreas, intestines, and thymus. Tissues likes bones, tendons (both referred to as musculoskeletal grafts), cornea, skin, heart valves, nerves and veins. The kidneys are the most commonly transplanted organs in the world, followed by the liver and then the heart. Corneae and musculoskeletal grafts are the most commonly transplanted tissues, more than tenfold of which are organ transplants.

A subset of allografts in which organs or tissues are transferred from a donor to a genetically identical

recipient (such as an identical twin). Differentiated methods like isograft from other types of transplantation because, while they are anatomically identical to allografts, they do not trigger an immune response

The procurement of organs for transplantation involves the removal of organs from the bodies of the deceased. This removal must comply with legal requirements, including the definition of death and consent

Donation by well-chosen living donors with good health coverage carries negligible risks. This can only be ensured through rigorous selection procedures, careful surgical nephrectomy and donor follow-up to ensure optimal management of undesired consequences.

To enhance the field and make people aware of it. The organizing committee decided to hold a conference. Organ transplantation is one of the fast growing and developing areas of surgery

People who have missed attending the past conference are most welcome to present your research ideas at the 2020 organ transplantation conference. This conference will help you improve networking with eminent people in the field of transplantation.
